

You're Not Actually Bad at Math: Response

I agree to most of the content in this essay. This essay shows how the society is like and what people usually think about math. Math scares most of the people and most of the reason is that people do not study it in the right way which is why math is hard for them. Moreover, it might be hard to understand math at first, but once you truly understand it would be fun for you to learn more of it.

First of all, it is actually true that people freak out too much when they could not do something and math is one of the example. Most people are scared to do math when they do not even start learning it. Math is not actually too hard or impossible for anyone if they are really into it and they put effort and practice. Everything in this World takes time and learning. No one is smart since they are born.

From the passage, it is stated that students or kids usually study math in a wrong way. Instead of learning it and doing practices, they start to memorize all of the math tricks which do not help them to learn math at all. I totally agree with this because most of the friends in my class do actually study math this way which I totally disagree. To study math for me, I think that you need practices and the most significant method is to be patient. Make the effort to solve the problems that you are given, then you will be able to do them.

During the beginning of the process of learning math, everything would seem so hard and impossible to do. But if you continue to learn it, it will get easier. It is true from the passage that if you miss a part in math, you would not be able to do the next parts. Most of the lessons in math are related. So if you understand every lesson that you learn, learning the next one will be easy as a pie. I think that just being able to catch up or follow along the class is a very easy way to learn math. The most important thing about math is to keep learning. If you can do the basics, leaning the advance would be so easy for you.
